

Administrator Manual

A route-by-route guide to reviewing evidence, maintaining public intelligence, publishing records, and learning from beta use.

Access

All /admin routes are private, noindex, and restricted to Andrew's administrator identity. Public navigation does not expose an admin link.

The publication boundary

Action	Public immediately?	Primary records affected
Stage intake	No	research_runs, candidate_changes
Accept candidate	No	review_decisions, candidate_changes
Publish approved batch	Yes	organizations or demand tables, citations, audit_events
Edit published organization	Yes	organization, location, capability, domain/cluster links
Edit demand signal	Yes	source, issuer link, demand source, requirements; dependent IDs preserved
Publish demand match	Yes	capability_demand_matches, field_citations, audit_events

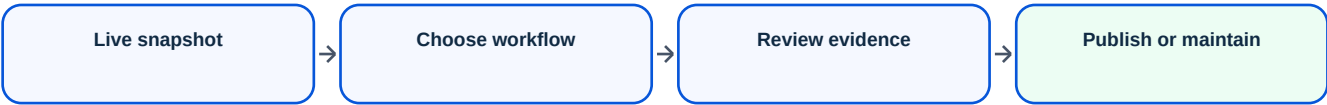

Golden rule

If the source cannot support the sentence, do not improve the sentence. Unknown stays unknown; interpretation stays labelled as derived.

True North Map operations

/admin

Start here to see what is public, what is waiting, and which editorial workflow needs attention.

What everything means

- Published organizations and demand signals come from the live production database.
- Pending candidates have not passed review. Ready to publish means accepted but still private.
- Public submissions count claims, corrections, and suggested organizations waiting for attention.

Controls and fields

Control	Meaning
Metric cards	Live counts, not task estimates
Workflow cards	Links to each operational route
Publication boundary	Reminder that acceptance and publication are separate

Examples

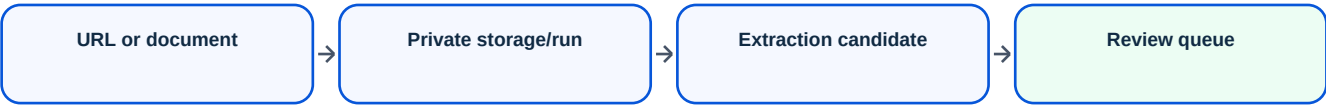

- Open the Review queue when Pending candidates is above zero.
- Open Publish only after evidence and duplicate checks are complete.
- Use Coverage to choose research priorities; do not use the overview count as a quality score.

Database effect	Read-only dashboard. Queries published tables, candidate_changes, and submissions; it writes nothing.
-----------------	---

Source and PDF intake

/admin/intake

Create a private work item from a public URL or a document without turning its contents into a public claim.

What everything means

- Choose public, permissioned, or internal visibility before staging.
- Public URLs remain source leads until extraction and review are complete.
- Uploaded files go to private storage; raw documents never enter the public media bucket.

Controls and fields

Input	What to enter
Source URL	Canonical HTTPS page, not a search result
Document	PDF or source file requiring private extraction
Notes	What to extract, verify, or keep private
Visibility	The strongest restriction required by the source

Examples

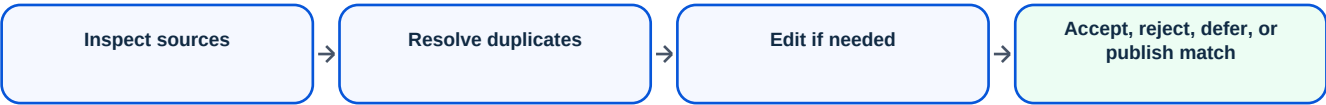

- Stage an official innovation challenge URL and note the problem statements to extract.
- For a colleague's email, use internal visibility and never cite it publicly without permission or corroboration.

Database effect	Writes research_runs and candidate_changes. A document upload also writes to atlas-private-intake. No canonical record changes.
-----------------	---

Review queue

[/admin/review](#)

Decide whether staged evidence is complete, non-duplicative, and useful enough to reach the publication checkpoint.

What everything means

- Organization candidates cover companies and ecosystem entities; demand candidates cover public problem statements.
- Accept moves organization or demand candidates to approved. It does not publish them.
- Demand-match cards are different: Publish match is the explicit publication action on that card.
- Defer keeps work private; reject closes an unsupported or irrelevant candidate.

Controls and fields

Term	Meaning
Evidence confidence	Strength and directness of public support
Duplicate check	Whether a canonical record may already exist
Reviewer rationale	Why the decision is defensible
Why this match should be public	Public-value and evidence rationale for a derived match

Examples

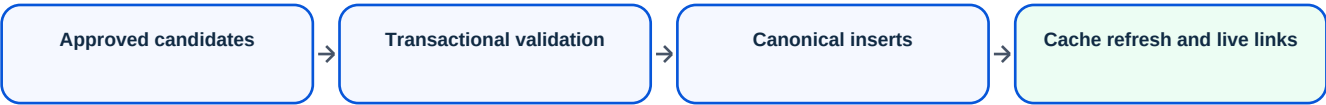

- Reject a technology match based only on broad keywords.
- Publish a match only when the capability function addresses a stated outcome and the caveat is clear.
- Merge a duplicate candidate into the existing canonical organization rather than creating a second profile.

Database effect Writes review_decisions, candidate_changes, and audit_events. Publishing a match also creates capability_demand_matches and inherited field_citations.

Publication checkpoint

/admin/publish

Turn reviewed organization and demand-signal candidates into canonical public records with one explicit transaction.

What everything means

- Only approved organization and demand-signal candidates appear here.
- The batch is all-or-nothing: any invalid record stops the transaction.
- Review live links after success; no application redeploy is required for data publication.
- Technology-to-demand matches do not use this batch screen; they publish from their review card.

Controls and fields

Before pressing Publish	Required check
Source	Canonical, public, durable, and supports the key fields
Duplicate	Clear or intentionally merged
Record shape	Location and capability present for commercial organizations
Language	Outcome-led but no stronger than the evidence

Examples

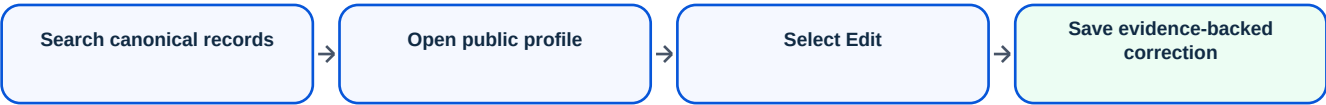

- A reviewed company with one capability and citations can be published here.
- A newly accepted public demand source and its problem statements can be published in the same batch.

Database effect	Calls the restricted publication function. Writes canonical records, evidence links, review status, publication timestamps, and audit events in one transaction.
-----------------	--

Published organizations

/admin/organizations

Find the canonical public profile you need to maintain without entering the research queue.

What everything means

- Search across organization name, city, province, technology, and technical tags.
- View opens the public profile in a new tab; Edit opens immediate public maintenance.
- Use this route for corrections to already-published facts, not for unverified additions.

Controls and fields

Result element	Meaning
Organization	Canonical entity row
Location	Primary published map location
Technology	Published capability attached to the entity
View	Current public dossier
Edit	Relationship-safe maintenance form

Examples

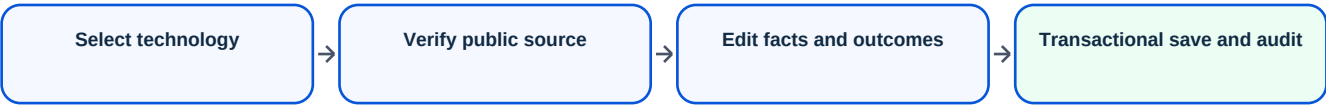

- Search 'Winnipeg' to find StandardAero, inspect the live dossier, then edit only after checking its official source.
- If a record lacks a location or capability, return it to the review workflow instead of forcing an incomplete save.

Database effect	Reads the published atlas snapshot. This list writes nothing; the edit route performs the transactional update.
-----------------	---

Edit a published organization

[/admin/organizations/\[id\]/edit](/admin/organizations/[id]/edit)

Correct the public dossier while keeping its stable profile, capability, location, and taxonomy relationships intact.

What everything means

- Public contact accepts only an official public contact page or approved general business contact.
- Organization copy says what the company helps a user do; technology copy says what the system changes operationally.
- Primary technology area is the main discovery category. Additional areas broaden accurate discovery without replacing the primary.
- Cluster is a curated ecosystem grouping, not a synonym for province.

Controls and fields

Section	Database effect
Public contact	organizations.profile_data
Organization	organizations
Location	locations; organization_locations link preserved
Technology	capabilities
Technology areas	capability_domains replaced transactionally
Cluster	capability_clusters replaced transactionally

Examples

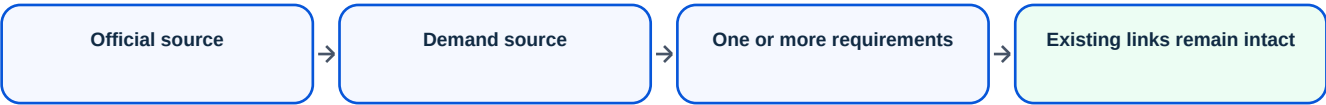

- Change a summary after verifying the first-party product page; explain the checked source in Change rationale.
- Do not add a TRL, headcount, contact, or financing value when the public source does not support it.

Database effect	Calls update_published_organization_dossier. Stable IDs and slugs remain intact; linked demand and mission matches continue to point to the same capability.
------------------------	--

Manage demand signals

/admin/demand-signals

Add or maintain public problem statements so users can see what needs solving and compare relevant Canadian technology.

What everything means

- Use only authoritative public sources. The title and summary explain why the source matters; requirements capture individual problems and outcomes.
- Directional means an articulated need. Programmatic means a structured or funded pathway. Procurement means an active buying notice.
- Editing an existing requirement preserves its stable ID, so every technology match and citation remains connected.
- Adding a new problem statement creates a new requirement; it does not generate matches automatically.

Controls and fields

Field	Meaning
Issuing authority	Canonical public organization that issued the signal
Signal type	What the source actually represents
Commitment level	How close the source is to structured action
What needs to change	Problem visible to industry
What success looks like	Outcome the issuer is seeking
Public caveat	Limits on what users may infer

Examples

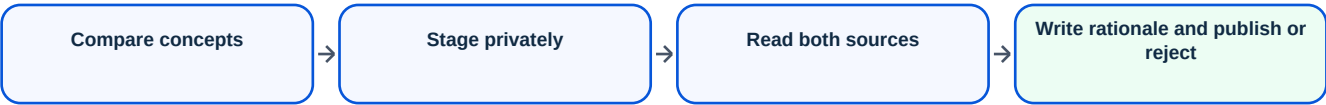

- Update the wording of a NATO problem statement while preserving its ID and seven linked matches.
- Add a Canadian innovation challenge from its official page, with each discrete problem captured separately.

Database effect Calls `upsert_published_demand_signal`. Updates sources, the primary `demand_source_issuers` relationship, `demand_sources`, and `demand_requirements` transactionally; writes an audit event and refreshes all demand and technology pages.

Demand matches

/admin/demand-matches

Find plausible capability-to-problem connections, then publish only the relationships that help a user make a better decision.

What everything means

- Find potential matches stages up to 20 private suggestions based on shared mission concepts.
- A suggestion is a research prompt, not evidence. It must be checked against both public profiles.
- The public rationale explains the functional connection, customer consequence, and important caveat.
- Published matches are labelled as our interpretation and never imply eligibility, endorsement, or classified demand.

Controls and fields

Decision test	Question
Specific	Can you name the capability function and demanded outcome?
Supported	Do both sides have durable public citations?
Useful	Would the connection change who a BD user investigates?
Bounded	Does the text state what remains unproven?

Examples

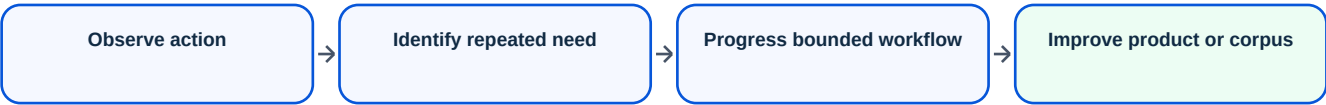

- Publish StandardAero to logistics because its official evidence covers military propulsion MRO and fleet support.
- Reject an underwater sensor to a drone-ranging challenge when the only overlap is the word 'detection'.

Database effect Stages research_runs and candidate_changes. Publication creates capability_demand_matches, copies citations from both linked records, records the reviewer, and refreshes public profiles.

Public-beta operations

/admin/insights

Turn user activity into a short list of product, data, and follow-up decisions without building a general-purpose CRM.

What everything means

- Progress connection requests, contacts, contributions, and feedback with private notes and bounded statuses.
- Subscriber rows are consent records; do not send campaigns until sender identity and unsubscribe are configured.
- Prioritize repeated zero-result searches and broken journeys over raw page-view volume.
- Raw search text is private and retained for 90 days; workflow events are bounded to meaningful actions.

Controls and fields

Panel	Use it for
Workflow funnel	Where users stop between search and action
Connection requests	Human-vetted introduction decisions
Contact inbox	General, partnership, media, privacy follow-up
Contributions	Claims, corrections, and new organizations
Feedback	What worked and what is missing
Subscribers/searches	Consent export and discovery gaps

Examples

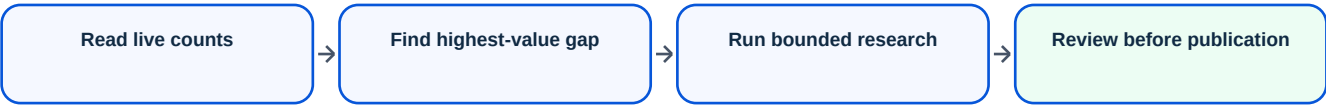

- If users repeatedly search a missing company, prioritize evidence collection for that entity.
- Move a credible partnership request from new to reviewing, record a private note, and broker the introduction outside the app.

Database effect Uses private connection_requests, contact_messages, submissions, feedback, signup, search, and event tables. Physical pilot_* names are historical database names; the product workflow is Public Beta.

Coverage and freshness

/admin/coverage

Choose the next research gap from visible evidence instead of padding the database or chasing a headline count.

What everything means

- Regional coverage shows where organizations are represented on the map.
- Technology and Mission Area counts show whether users can investigate a coherent landscape.
- Public demand matches show which problem statements have reviewed Canadian technology connections.
- Zero is a valid finding. Do not fill a gap with a weak or irrelevant record.

Controls and fields

View	Decision it supports
Region	Where discovery is thin
Technology area	Which capability landscape needs depth
Mission Area	Whether a use case has enough reviewed supply
Public demand	Which official problems still have no defensible matches

Examples

- A zero-match medical problem should trigger targeted research, not a forced mapping from unrelated technology.
- When one region dominates a technology area, seek durable sources in other regions before expanding the taxonomy.

Database effect	Read-only. Builds counts from the live public atlas snapshot; it does not schedule agents, stage candidates, or publish records.
-----------------	--

How the records stay connected

Reference

Stable identifiers—not display text—hold the public graph together. This is why copy can improve without detaching profiles, evidence, or demand alignment.

Relationship	Key and cascade behaviour
Organization -> technology	capabilities.organization_id; organization deletion cascades, normal edits preserve ID
Technology -> demand match	capability_demand_matches.capability_id; technology edits preserve matches
Demand source -> requirement	demand_requirements.demand_source_id; editor preserves existing requirement IDs
Demand source -> issuer	demand_source_issuers; the editor changes only the primary issuer link and preserves sponsor links
Requirement -> demand match	capability_demand_matches.demand_requirement_id; copy updates do not change the key
Record -> evidence	field_citations points to evidence_snippets, which points to sources
Every material change	review_decisions or audit_events records who, why, and when

Safe maintenance checklist

- Open the public source and confirm it still supports the field.
- Write the customer consequence without adding facts the source does not establish.
- Preserve stable slugs and IDs; use the route's transactional save function.
- State uncertainty and distinguish public-source alignment from procurement or endorsement.
- Open the public profile after saving and verify the expected relationships still appear.

Current live state35 published organizations, 31 published technologies, 2 demand sources, 6 public problem statements, and 7 reviewed public demand matches at the time this manual was generated.
