

True North Map

Product, brand, evidence, research, visibility and release operating picture

Make Canadian capability visible.

Production Public Beta | truenorthmap.ca | 26 July 2026

PUBLIC PRODUCT	Evidence-led discovery across Canada's defence and dual-use ecosystem.
SOURCE OF TRUTH	Supabase project facoactpdckkhciamflk. Live counts must be read from production.
PUBLICATION	Agents stage evidence. People review interpretation. Publish remains explicit.
REPORT STATUS	Dated readable snapshot. Canonical governance documents remain authoritative as the project changes.

EXECUTIVE VIEW

Executive view

True North Map is a production, evidence-led discovery platform for Canada's defence and dual-use ecosystem. It combines national discovery, organization and technology dossiers, released Public Needs, reviewed relevance assessments, Canadian Defence Briefs, Ask True North, Working Lists, public participation, and a private administration system.

The product is beyond its original beta checklist. Phase 1B established the North Signal identity and coherent public experience. Phase 2 hardened scale, resilience, sessions, health, security, retention, visibility validation, launch collateral, and rollback. The next challenge is disciplined operation and broader distribution, not another foundational rewrite.

The operating principle

Production Supabase is the public record. Research and AI stage reviewable work. People approve interpretation. Publication is a separate human action.

Clear national discovery journey	Live counts and queue state must come from production
Visible public evidence and gaps	No research artifact or AI result becomes public automatically
Coherent brand and current launch kit	Visible product changes require current screenshots and metadata
Repeatable release validation	A build is not a complete regression result

MISSION AND STRATEGIC WEDGE

Mission and strategic wedge

True North Map helps a business development, product, strategy, or ecosystem user move from a real mission question to the Canadian organizations worth understanding and speaking with.

01 START Mission, use case, technology, place, or public need	02 FIND Relevant Canadian organizations and technologies	03 INSPECT Evidence, confidence, gaps, and tradeoffs	04 ACT Working List, export, correction, or introduction
--	---	---	---

Primary users

Business development and engagement teams deciding who to engage first; product and strategy users validating mission-led landscapes; reviewers maintaining a defensible evidence-backed dataset.

Deliberate non-goals

A broad CRM, sales-sequencing system, official procurement directory, classified-demand source, or autonomous publishing platform.

PUBLIC PRODUCT AND TRUST

Public product and trust

The product is designed as one connected journey rather than a set of independent pages. Every surface should answer what the visitor can see, why it matters, what supports it, what remains unknown, and what to do next.

Map	Explore the complete matching national set	Published records only
Organizations and technology	Understand who offers what and why it may matter	Facts and assessments are separate
Public Needs	Follow released needs to possible Canadian technology	Released-source gate
Ask True North	Search the live corpus in natural language	Known records and safe fallback only
Defence Briefs	Read source-linked strategic synthesis	Reviewed editorial interpretation
Working Lists	Carry targets into a real conversation	Private to the signed-in owner
Contribute or connect	Correct, suggest, claim, or request help	Review first; no automatic public change

The three public states

Source-backed fact What a released or official source says.	Our assessment A reviewed interpretation of possible relevance.	Coverage gap What is missing, thin, stale, or unverified.
---	---	---

NORTH SIGNAL BRAND

North Signal brand

The angular N, evidence path, and yellow signal point create a confident identity without borrowing military visual cliches. The system is disciplined: charcoal and warm white carry the interface; yellow marks the next useful action or a short piece of meaning.

Canada is building more than most people can see.

Brand promise	Make Canadian capability visible.
Category	Evidence-led ecosystem discovery
Journey	Follow the evidence. Find the fit. Start the right conversation.
Trust	Reviewed public evidence · Transparent gaps · Human review

Canonical packet

Production SVGs live in app/public/brand/. Current launch assets live in content/launch/phase-2/. The brand packet index is content/brand/True North Map Brand System.md. Screenshots and demo files from July 18 are historical and must not be used for the current release.

ARCHITECTURE AND SOURCE OF TRUTH

Architecture and source of truth

Next.js app	Routes, APIs, actions, tests, integrations, migrations	An alternate corpus
Production Supabase	Records, taxonomy, evidence, review, auth, storage, audit	An unreviewed agent sink
Research lineage	Typed leads, candidates, signals, reviews, staging	Runtime data
Project-local skills	Executable operating contracts	A substitute for current code
Governance	Decisions, boundaries, regression, runbooks	A stale task dashboard
Content	Brand, launch, and campaign collateral	A source of factual record
Private wiki	Raw packets and evergreen synthesis	Direct public content
Visibility workspace	Read-only provider evidence and private reports	Public analytics warehouse

Production Supabase is the only canonical runtime. Exact corpus and queue counts are read live; they are never frozen into operating contracts or this report.

RESEARCH PIPELINE

Research pipeline

Research is designed for yield without sacrificing publication control. Broad discovery, named dossiers, and signal refresh all converge on the same private Admin Review and explicit Publish checkpoint.

1	Autonomous research	Coverage selection and bounded orchestration
2	Signal refresh	Atomic changes from balanced sources
3	Source discovery	Prospects and durable qualified leads
4	Candidate builder	Supported typed private bundle
5	Evidence mapper	Field citations and labelled relevance

6	Candidate logo	Private official-logo disposition
7	Review steward	Deterministic validation and private intake

Human boundary

A run is complete when its validated candidate is visible in Admin Review. Acceptance and publication are separate human decisions. The deployed /api/system/research-contract, Admin Review UI, and Publish path must all support a candidate kind before live staging.

Integration state

Six stages are present in the production-aligned clean checkout. Candidate-logo integration is active in the primary workspace and becomes deployed only when its skill, commands, schemas, tests, and documentation merge together.

PRIVATE VISIBILITY INTELLIGENCE

Private visibility intelligence

The tnm-visibility workflow measures whether useful public content can be discovered, understood, cited, and trusted. It complements research, but it is not an ingestion or publication skill.

Search Console and GA4	Dated query/page and landing-page evidence	Improve an existing useful page
PageSpeed and technical checks	Bounded route findings	Repair crawl, metadata, schema, or performance
Bing and Ahrefs exports	Search and earned-link context	Review a credible page-specific opportunity
Capped DataForSEO	Canada-specific validation	Confirm or reject a hypothesis
AEO/GEO review	Answer and evidence quality brief	Route through normal editorial review

Raw provider data, credentials, queries, referrals, snapshots, and reports remain ignored under research/visibility/local/. No provider write, indexing submission, outreach, link purchase, public route change, or Supabase write is authorized by a visibility report.

Integration state

The skill and CLI are active local integration work. Private successful reports are evidence for decisions, not proof that the clean repository or production deployment contains the integration.

PHASE 1B AND PHASE 2

Phase 1B and Phase 2

Phase 1B made the product coherent. Phase 2 made it safer to share broadly.

North Signal identity and current social assets	Compact all-organization map/search projection
One message system and evidence language	Bounded retry, warm snapshot, and record caching
Public Needs collection language with canonical URLs retained	Stale-session cleanup and /api/health
Coherent navigation and responsive public experience	CSP, retention cleanup, and campaign attribution
Brand-consistent launch materials	Low-rate canonical crawl, scorecard, runbook, and rollback

Dated validation

The production-aligned Phase 2 release recorded 175 passing tests, successful lint and release validation, a clean production build, responsive browser checks, and a canonical crawl without outstanding findings. Future changes must rerun the applicable checks; these dated results cannot be inherited automatically.

SECURITY, PRIVACY, AND OPERATIONS

Security, privacy, and operations

Public data	Anonymous read of published intelligence only
Member data	Owner-private Working Lists, submissions, connections, and account
Administrator	Unlinked, noindex, exact owner identity, server-side failure closed
Authentication	Google OAuth and passwordless email; branded Resend SMTP
Human mail	Zoho monitored mailbox and aliases
Updates	Supabase consent ledger and MailerLite delivery
Retention	90-day raw search text and 30-day detailed workflow events
Optional diagnostics	Consent-gated; private routes excluded; Clarity dormant until configured

Secrets, private evidence, raw research, local visibility data, provider credentials, and administrator detail never enter public responses or tracked launch collateral.

WHOLE-PROJECT REGRESSION CONTRACT

Whole-project regression contract

A material task is not complete when one route works. It must preserve the mission-to-engagement journey, publication boundary, security, accessibility, analytics consent, metadata, brand, and production build.

Application/shared library	pnpm test; pnpm lint
Research skill or schema	data:readiness; research:validate; deployed contract; review-card inspection

Visibility integration	visibility:validate; tests; lint; build when app changes
Public route or metadata	launch:validate; canonical, schema, social, internal-link checks
Production release	release:validate; browser matrix; /api/health; logs; live data state

Browser matrix

Public layout and interaction changes are checked at 390, 768, 1024, and 1440 pixels, including keyboard order, focus, tap targets, overflow, image dimensions, map/list synchronization, and the touched user journey.

Completion evidence

Every handoff records what changed, cross-system impacts considered, commands and workflows run, production state verified or not verified, and any safe known exception. A check that was not run is never described as passing.

CURRENT PRIORITIES AND GATES

Current priorities and gates

Candidate-logo skill	Active local integration	Merge complete contract and run research regression
Visibility skill	Active local integration	Merge tracked code only; exclude local provider artifacts
Microsoft Clarity	Optional, dormant	Configure only with explicit privacy and consent verification
Additional form Turnstile	Optional hardening	Add server credential and test focused flows
Corpus and queues	Live and changing	Read production before every decision or public claim
Outreach and campaigns	Prepared, never autonomous	Andrew authorizes each action

The immediate operating priority is disciplined broader sharing: use the current launch kit, monitor meaningful product signals, triage public feedback and contributions, improve high-value content from evidence, and keep the research and visibility systems review-led.

CANONICAL PROJECT MAP

Canonical project map

AGENTS.md	Operating contract and change log
True North Map Project Overview.md	Product, terminology, architecture, and trust picture
Project Status.md	Current deployed and integration posture
Cross-System Change And Regression Contract.md	Impact and validation requirements

Skills And Automation Map.md	Research, visibility, cadence, and authority map
Admin Workflow And Data Contract.md	Review and publication rules
Autonomous Ecosystem Research Pipeline.md	Research orchestration
True North Map Brand System.md	Approved identity, copy, tokens, assets, and checks
Phase 2 Release Runbook.md	Deployment, rollback, incidents, and optional gates

This PDF is the readable snapshot. The documents above, current code, production Supabase state, and deployed application evidence are the source of truth for future work.

Decision rules for future work

Changes public wording or design	Preserve evidence meaning, approved brand roles, metadata, accessibility, analytics events, and current launch assets
Changes research output	Update every downstream contract and stop at private Admin Review
Uses search or visibility evidence	Keep raw inputs private and route recommendations through normal product or editorial review
Changes canonical data	Use reviewed migrations or explicit human Publish, then verify affected public routes
Appears complete locally	Run the relevant integrated and production checks before claiming release readiness

North Star

Every new capability should help a user see Canadian capability more clearly, understand why it may matter, inspect what supports it, recognize what remains unknown, and move into a better-informed conversation. If it does not strengthen that journey, it should not displace the work that does.
